L Submitted (MAR-2002) to the EMBL/GenBank/DBBJ databases.
Submitted (MAR-2002) to the EMBL/GenBank/DBBJ databases.
-!- SIMILARITY: Belongs to the acyl-CoA dehydrogenase family.
-!- CAUTION: The sequence shown here is derived from an EMBL/GenBank/DBBJ whole genome shotgun (WGS) entry which is preliminary data.

Claim 1; Page 117-119; 136pp; English

Sequences AAB73668-AAB73694 represent 27 novel human oxidoreductase proteins, designated ORP-1 to ORP-27 respectively, and sequences AAH24223 corrected acids are useful for diagnosing, treating or preventing cell canded acids are useful for diagnosing, treating or preventing cell proliferative disorders (e.g. arteriosclerosis, cirrhosis, psoriasis, cancers); endocrine disorders (e.g., type I or II diabetes mellitus, cancers); endocrine disorders (e.g., type I or II diabetes mellitus, conclusionatorio disorders (e.g., obealty, phenylketonuria, osteoporosis); conclusionatorio disorders (e.g., obealty, phenylketonuria, polycystic ovary disease, disruption of spermatogenesis, impotence); neurological cisorders (e.g., epilepsy, stroke, Alzheimer's disease, Huntington's disease, Parkinson's disease, meningitis, Creutzfeldt-Jakob disease, cerebral palsy, muscular dystrophy, mood, anxiety and schizophrenic cerebral palsy, muscular dystrophy, mood, anxiety and schizophrenic disorders); viral, bacterial, fungal and parasitic infections; and autoimmune/inflammatory disorders such as acquirized immunodeficitiency syndrome (AIDS), allergies, asthma, Crohn's disease, atopic dermattitis, Human of RP proteins and nucleorides can be used to identify compounds which modulate their activity or expression. ORP mucleic acid sequences con may also be used for assessing the toxicity of a test compound, to detect may also be used for assessing the toxicity of a test compound, and issease. Oligonucleotide primers derived from ORP gene sequences may be used to detect single nucleotide polymorphisms (SNPs) and for mapping the nativally or expression british and parasitic animals or nativally or expression british and parasitic animals or nativally or expensed from order animals or transgenic animals to may be used to detect single nucleotide polymorphisms (SNPs) and for mapping the paramics and parasitic state sequences and paramics and sequences and paramics and sequences and paramics and sequences and paramics and sequences and paramic naturally occurring genomic sequences. Antibodies specific for ORP proteins may be used in the diagnosis of disorders associated with aberrant ORP expression, in assays to monitor patients being treated with ORP or modulators thereof, and for assessing toxicity of potential drugs

The present invention describes primer sets for synthesising 5602 full-

(a) an oligo-dr primer and an oligonaclectide complementary to the

complementary strand of a polymucleotide which comprises one of the 5602

complementary strand of a polymucleotide which comprises one of the 5602

coligonacleotide comprises at least 15 nucleotides; or (b) a combination

of an oligonacleotide comprises as sequence complementary to the

complementary strand of a polymucleotide which comprises a 5'-end

complementary strand of a polymucleotide which comprises a 5'-end

complementary strand of a polymucleotide which comprises a 5'-end

complementary strand of a polymucleotide which comprises a 5'-end

complementary strand of a polymucleotide which comprises a 5'-end sequence and an oligonacleotide comprises a 1'-end sequence, where the

coligonacleotide which comprises a 1'-end sequence, where the

coligonacleotide which comprises a 1'-end sequence, where the

coligonacleotide which comprises a 1'-end sequence, where the

coligonacleotide which sets as a 1'-end sequence, where the

coligonacleotide comprises a 1'-end sequence in selected from those defined in the

coliforation. The primer sets can be used in antisense therapy and in

specification and/or diagnosis of the abnormality of the proteins encoded by

the full-length cDNAs. The primers allow obtaining of the full-length

conname and/or diagnosis of the abnormality of the full-length

conname and/or diagnosis of the abnormality of the full-length

conname and/or diagnosis of the abnormality of the full-length

conname and/or diagnosis of the abnormality of the full-length

coligonacleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          180

                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human dehydrogenase (DHDR)-7 polypeptides
referred to as 62112 and nucleic acid molecules encoding such
referred to as 62112 and nucleic acid molecules encoding such
referred to as 62112 and nucleic acid molecules encoding such
collypeptides. DHDR-7 is an acyl-CoA dehydrogenase, a mitochondrial
flavoprotein which catalyses the first step of fatty acid beta-
coxidation. Sequences of the invention and their antibodies are useful for
treating a disorder, disease or condition which is caused by
misregulation (e.g. downregulation or upregulation) of DHDR activity.
Examples of disorders include central nervous system (CNS) disorders e.g.
Alzheimer's disease (AS), Pick's disease, Parkinson's, Huntington's
disease, Gilles de la Tourette's syndrome, multiple sclerosis, epilepsy,
amyotrophic lateral sclerosis and Creutzfeldt-Jakob disease; autonomic
cungraine, anxiety, obsessive-compulsive disorder and obesity; cardiac
migraine, anxiety, obsessive-compulsive disorder and obesity; cardiac
cungration disorder e.g. arteriosclerosis, ischaemia reperfusion injury,
restenosis, arterial inflammation, angina, hypertension, cardiomyopathy
and arthythmia disorders of musculus skeletal system paralysis, muscle
weakness e.g. ataxia; cell proliferation, growth, differentiation or
migration disorders e.g. cancer, diabetes mellitus, hypothyroidism or
immune deficiency disorders; hepatic disease or dysfunction and metabolic
disorders. They are used for screening assays, predictive medicine e.g.
diagnostic assays, prognostic assays, monitoring clinical trails, and
pharmacogenetics. Polypeptides of the invention
are used in gene therapy. The present sequence is human DHDR-7

for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including disbetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRF) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying a mitochondrial target for drug screening assays and for treating diseases associated with altered mitochondrial function, comprises detecting a modified polypeptide in a sample and correlating with the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to novel mitochondrial targets that can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 MetSerGlyCysGlyLeuPheLeuArgThrThrAlaAlaAlaArgAlaCysArgGlyLeu

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial concephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERAP) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention. Identifying a mitochondrial target for drug screening assays and for treating diseases associated with altered mitochondrial function, comprises detecting a modified polypeptide in a sample and correlating with the disease. Claim 1; SEQ ID NO 2053; 180pp; English. WPI; 2003-845369/78.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes an isolated polynucleotide (I): (a) comprising a nucleotide selected from SEQ ID NO:1-244; or (b) which encodes a polypeptide with bological activity, where the polynucleotide hybridises to (I) under stringent hybridisation conditions or has greater than 99% sequence identity with (I). (I) has respiratory, cytostetic, antiarthritic, antiinflammatory, gastrointestinal, antibacterial, immunosuppressive, antidiabetic and antirheumatic activities, and can be used in gene therapy. (I) can be used for

cc generating polynucleotides encoding chimeric or fusion proteins and heterologous protein sequences. The polynucleotides can be used to express recombinant protein for analysis, characterisation or therapeutic use; as markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags to identify chromosomes or to map related gene consumed to compare with endogenous DNA sequences in patients to dentify potential genetic disorders; as probes to bybridise and discover genes; related DNA sequences; as a source of information to derive PCR primers for genetic fingerprinting; as a probe to subtract-out known sequences in the process of discovering other novel polynucleotides; for selecting and making oligomers for attachment to a gene chip or other support, including for examination of expression patterns; to raise anti-one antibodies using DNA immunisation techniques; to raise anti-one antibodies using DNA immunisation techniques; to raise anti-one crides and polypeptides can also be used as nutritional sources or support, as a prirogen source or as a source of carbohydrates. The solution source, as an irrogen source or as a source of carbohydrates. The compositions are useful for promoting better or faster closure of non-chaling wounds, for the generation and reatment of lung or liver fibrosis, reperfusion injury in various tissues, and conditions resulting from systemic cytokine damage. The compositions can also be used to treat inflammatory conditions (e.g. arthritis, inflammatory bowel disease or crohy sisease), sepsis, rheumatodia arthritis, diabetes mellitus type 1 or crohy spatide sequence from the present invention. Novel polypeptides and polynucleotides useful for diagnosing, preventing treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases

Claim 11; SEQ ID NO 1004; 1180pp; English

The present invention relates to the isolation of novel human enzyme polypeptides, and the CDNA (AA40785-AA541684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases The sequences of the invention are useful in the disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), introductive disorders (e.g. athematory disorders (e.g. athematory disorders (e.g. athematory disorders (e.g. athematory disorders (e.g. athematory disorders (e.g. athematory disorders (e.g. athematory disorders (e.g. athematory disorders (e.g. athematory disorders (e.g. athematory disorders (e.g. athematory disorders (e.g. athematory disorders (e.g. athematory disorders (e.g. athematory disorders (e.g. infectious disorders (e.g. Influenza). The polymuclectides of the invention can also be used in gene therapy. AAU22915-AAU23814 represent the novel human enzyme polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

Wang J; Weng G, Zhang J, Ren F, Xue A, 4J, Wang D, Zhao QA, Wang Z; Yang Y, Wer Ghosh MJ, Wehrman T, rang YT,

2004-143291/14. WPI; 2004-143291/ N-PSDB; ADM87558 New isolated polynucleotides and polypeptides, useful for treating, e.g. cancer, lung or liver fibrosis, arthritis, inflammatory bowel disease, Crohn's disease, rheumatoid arthritis, diabetes mellitus type 1 or graft versus host disease.

Example 2; SEQ ID NO 869; 591pp; English.

preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags to identify chromosomes or to map related gene positions; to compare with endogenous DNA sequences in patients to identify potential genetic disorders; as probes to hybridise and discover genes, related DNA sequences; as a source of information to derive PCR primers for genetic fingerprinting; as a probe to subtract-out known sequences in the process of discovering other novel polynucleotides; for selecting and making oligomers for attachment to a gene chip or other protein antibodies using DNA immunisation techniques; and as an antigen to raise anti-DNA antibodies or elicit another immune response. The corporation could supplements, as a national sources or supplements, e.g. as a protein or amino acid supplement, as a carbon source, as a nitrogen source or as a source of carbohydrates. The compositions are useful for promoting better or faster closure of nonchalling wounds, for the generation and resement of lung or liver interest. comprising a nucleotide sequence selected from SEQ ID No.1-244; or (b) which encodes a polypeptide with biological activity, where the polynucleotide hybridises to (1) under stringent hybridisation conditions or has greater than 994 sequence identity with (1). (1) has respiratory, cytostatic, antiarthritic, antianflammatory, gastrointestinal, antibacterial, immunosuppressive, antidiabetic and antirheumatic activities, and can be used in gene therapy. (1) can be used for pereating polynucleotides encoding chimeric or fusion proteins and hetrologous protein sequences. The polynucleotides can be used to express recombinant protein for analysis, characterisation or therapeutic use, as markers for tisques in which the corresponding protein is reperfusion injury in various tissues, and conditions resulting from systemic cytokine damage. The compositions can also be used to treat finlammatory conditions (e.g. arthritis, inflammatory bowel disease or Crohn's disease), sepsis, rheumatoid arthritis, diabetes mellitus type or graft versus host disease. The present sequence represents an The present invention describes an isolated polynucleotide (I): (a)

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397,
which represent the human ORFX open reading frames 1 to 3161. The ORFX
sequences have activities such as: cytostatic; hepatotropic; vulnerary;
antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic;
anticonvulsant; antiarthritic; immunosuppressant; immunostimulant;
cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive;
cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive;
cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive;
cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive;
cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive;
cardiant; thrombolytic; coagulations antidiabetic. The
sequences can be used for determining the presence of or predisposition
to, or preventing or treating pathological conditions associated with an
CC ORFX-associated disorder. The nucleic acids can be used to express ORFX
proteins in gene therapy vectors. The proteins and nucleic acids may be
used to treat cancers, proliferative disorders, neurodegenerative
disorders mellitus, hypotension; hypothyroidism, cholesterol seter
catorage, systemic lupus erythematosus, severe combined immunodeficiency
disorders asthma, allergies, aplastic ansemia, burns, wounds, bone and
catrilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to
enhance coagulation; to inhibit thrombosis; and as a contraceptive Sequence 565

Yamamoto J; Ota T, Isogai T, Nishikawa T, Hayashi K, Saito K, Ya Ishii S, Sugiyama T, Wakamatsu A, Nagai K, Otsuki T; WPI; 2001-318749/34.

Primer sets for synthesizing polynucleotides, particularly the 5602 full-length CDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length CDNAs.

Claim 8; SEQ ID NO 14271; 2537pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 fulllength cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonnclectide complementary to the complementary strand of a polynuclectide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonnclectide comprises at least 15 nucleotides; or. (b) a combination of an oligonnclectide comprising a sequence complementary to the complementary strand of a polynuclectide which comprises a 5'-end sequence and an oligonnclectide comprising a sequence complementary to a polynuclectide which comprises a 3'-end sequence complementary to a polynuclectide which comprises a 1'-end sequence. Or sequence complementary to a polynuclectide which comprises a 1'-end sequence of sequence of sequence of sequence of sequence complementary to a polynuclectide which comprises a 1'-end sequence of sequence complementary to a polynuclectide which comprises a 1'-end sequence, where the combination of the 5'-end sequence of sequence of sequence, and a sequence of sequence of sequence, and complementary to a polynuclectide which or primer set selected from those defined in the gene therapy. The primers are used in antisense therapy and in gene therapy. The primers are useful for synthesising polynuclectides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs represent human amino acid sequences; and AAH13629 to AAH13622 represent human amino acid sequences; and AAH13629 to AAH13622 represent complement of the exemplification of the present invention

The present invention relates to the isolation of novel human enzyme polypeptides, and the CDNA (AAS40785-AAS41664) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. infectious disorders (e.g. influenza). The polymucleotides of the invention can also be used in gene therapy. AAU22915-AAU23814 represent the novel human enzyme polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published\_pot\_sequences

MD25 has antidiabetic activity. TRAP and GLTA are involved in the intracellular regulation of glucose metabolism and glucose transport across the cell membrane. Expression of MD25 (whose ligands are these proteins) is also involved in this regulatory process. MD25 can be used in the prevention, treatment and diagnosis of diseases involving disturbances of glucose metabolism, such as diabetes and other hyperglycaemic disorders. The present sequence represents mouse VLCAD which is given in the exemplification of the
                                                                                                                                                                                                                                                                                   Protein binding to insulin-responsive aminopeptidase and glucose transporter 4, useful for prevention and treatment of diseases associated with blood sugar level disturbance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        207

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes human MD25 (very long chain acyl-CoA dehydrogenase (VLCAD)), which binds to insulin-responsive aminopeptidase (TRAP) and to glucose transporter 4 (GLUT4). MD25 has antidiabetic activity. IRAP and GLUT4 are involved in the intracellular regulation of glucose metabolism and glucose transport across the cell membrane. Expression of MD25 (whose ligands are these proteins) is also involved in this regulatory process. MD25 can be used in the prevention, treatment and diagnosis of diseases involving disturbances of glucose metabolism, such as diabetes and other hyperglycaemic disorders. The present sequence represents rat VLCAD which is given in the exemplification of the present

The invention algebrass a composition to the mucleic acid sequence. Also derivative or allelic variation of the mucleic acid sequence. Also derivative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal composition of a polynucleotide sequence which is differentially expressed in neuronal tissue of a first animal compound that regulates the activity of one or more of the composition, a compound that regulates the activity of one or more of the polynucleotides, a method for identifying a pharmaceutical composition, a method for identifying a compound useful in treating pacification, a method for identifying a compound useful in treating pacitivity in an animal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides or more of pain and a pharmaceutical composition composition composition composition computed to a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain and spared nerve injury (SNI) in an animal composition of modulates its activity is useful for preparing a medicament for treating pain for the specification, which is differentially expressed during pain. Note: the specification, but was obtained in electronic form directly from wipo at the printed spared nerve injury (SNI) in an animal directly partited spared nerve injury (SNI) in a pain of the printed specification, but was obtained in electronic form directly fro

```
The present invention describes human MD25 (very long chain acyl-CoA dehydrogenase (VLCAD)), which binds to insulin-responsive aminopeptidase (TRAP) and to glucose transporter 4 (GLUT4). MD25 has antidiabetic activity. IRAP and GLUT4 are involved in the intracellular regulation of glucose metabolism and glucose transport across the cell membrane. Expression of MD25 (whose ligands are these proteins) is also involved in this regulatory process. MD25 can be used in the prevention, treatment and diagnosis of diseases involving disturbances of glucose metabolism, such as diabetes and other hypersylvaemic disorders. The present sequence represents bovine VLCAD which is given in the exemplification of the
                                                                                                                                                                                                                                      Protein binding to insulin-responsive aminopeptidase and glucose transporter 4, useful for prevention and treatment of diseases associated with blood sugar level disturbance.
                                                                                                                                                                                                                                                                                                                         Disclosure; Page 95-97; 103pp; Japanese.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 6562958

GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BADNANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERBNCE: GTC99-03PA
CURRENT FILLING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 6380
                                                                                                                                                                                                                                                                1104

Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: ACRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERENCE: 107196.136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR APPLICATION NUMBER: US 60/094,190
RIOR PILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 26058
